Each PCI-DAS1602/12 is tested at the factory to assure the board's overall error does not exceed accuracy limits described in Table 2.

As shown in Table 3, total board error is a combination of gain, offset, differential linearity error (DLE) and integral linearity error (ILE). The theoretical worst-case error of the board may be calculated by summing these component errors. Worst case errors are realized only in the unlikely event that each of the component errors is at their maximum level, and causing error in the same direction.

## Accuracy

Range	Absolute Accuracy
$\pm 10$ V	$\pm 3.0$ LSB

0 to +10 V	±2.0 max	±0.2 max	±1.0 max	±1.0 max
0 to +5 V	±2.0 max	±0.4 max	±1.0 max	±1.0 max

Each PCI-DAS1602/12 is tested at the factory to assure the board's overall error does not exceed ±3.0 LSB.

Total board error is a combination of gain, offset, integral linearity and differential linearity error. The theoretical worst-case error of the board may be calculated by summing these component errors. Worst case error is realized only in the unlikely event that each of the component errors are at their maximum level, and causing error in the same direction. Although an examination of the chart and a summation of the maximum theoretical errors shows that the board could theoretically exhibit a ±4.4 LSB error, our testing assures this error is never realized in a board that we ship.
