## Overview

### Channel-Gain Queue

The channel-gain queue feature lets users configure a list of channels and gains for each scan. Each channel can have a different gain setting. The gain settings are stored in a channel-gain queue list that is written to local memory on the device.

- The USB-1208LS channel-gain queue list can contain up to eight channels in SE mode and up to four channels in DIFF mode. The channels can be listed in any order.
- The USB-1208FS-Plus/1408FS-Plus channel-gain queue can contain up to eight unique channels in SE mode and up to four unique channels in DIFF mode. The channels can be non-consecutive, but must be listed in increasing order.

### Analog Output

The maximum analog output update rate for all devices depends on several factors, including USB port speed.

#### USB-1208LS

This device offers two 10-bit analog outputs with a range of 0 V to 5 V.

One analog output updates at a maximum rate of 100 S/s; two analog outputs update at a maximum rate 50 S/s each. The USB-1208LS updates in software-paced mode only.

#### USB-1208FS-Plus/1408FS-Plus

All devices offer two 12-bit analog outputs with a range of 0 V to 5 V.

When updating continuously from computer memory (hardware-paced mode), the analog outputs update at a maximum rate of 50 kS/s per channel.

### Concurrent AI/AO Scanning Operations (-Plus devices only)

All USB-1208FS-Plus/1408FS-Plus devices support executing an analog input scan and analog output scan at the same time.

### Digital I/O

All devices provide 16 TTL-level digital I/O lines. Digital I/O can be programmed on each 8-bit port (Port A and Port B) for either input (default) or output.

On the USB-1208FS-Plus and USB-1408FS-Plus, port B0 through Port B7 are high-current drive (24 mA) digital I/O connections.

### Event Counter Input

Each device supports one 32-bit TTL-level counter that accepts inputs up to 1 MHz.

### External Clock I/O (-Plus devices only)

The USB-1208FS-Plus and USB-1408FS-Plus have a bidirectional external clock terminal. When configured for input, A/D conversions can be paced by an external source.

These devices support TTL-level input signals up to 50 kHz.

When configured for output, these devices can pace A/D conversions on a second device.

### Trigger Input

The USB-1208FS-Plus and USB-1408FS-Plus each provide an external digital trigger input that is software-selectable for rising or falling edge, high or low level.

The USB-1208LS provides an external digital trigger input that is software-selectable for high or low level.

### Calibration

All USB-1208FS-Plus/LS/1408FS-Plus Series devices are factory-calibrated. Specifications are guaranteed for one year. For calibration beyond one year, return the device to the factory for recalibration.

The USB-1208LS also supports field calibration with InstaCal. Perform calibration whenever the ambient temperature changes by more than  $\pm 10^\circ\text{C}$  from the last calibration.

### OEM Versions (-Plus devices only)

The USB-1208FS-Plus-OEM and USB-1408FS-Plus-OEM have a board-only form factor with header connectors for OEM and embedded applications (no case, CD, or USB cable included). All devices can be further customized to meet customer needs.

*The USB-1208FS-Plus-OEM and USB-1408FS-Plus-OEM have the same specifications as the USB-1208FS-Plus/1408FS-Plus, but in a board-only form factor with header connectors instead of screw terminals.*

\* Self-powered USB hubs and hosts have their own power supply. The USB port(s) on your computer are root port hubs. All externally powered root port hubs (desktop computers) provide up to 500 mA of current for a USB device. Battery-powered root port hubs provide 100 mA or 500 mA, depending upon the manufacturer. A laptop PC that is not connected to an external power adapter is an example of a battery-powered root port hub.

Bus-powered USB hubs and hosts do not have their own power supply.
